

Text "water cycle"

1. The cloud is full of raindrops. The cloud breaks open. The rain falls out of the cloud. This is what you call "precipitation"
2. If it is very cold the rain turns into snow or hail stones.
3. The rain falls to the earth.
4. The sun comes out. It is hot.
5. The sun dries up the rainwater.
6. The sun turns the water into water vapour. This is what you call "evaporation". Usually you can't see the water vapour.
7. The warm air takes the water vapour up into the sky. It is cold in the sky.
8. The water vapour turns into drops of water. This is what you call "condensation". The drops of water make a cloud. The drops bump into one another and make bigger raindrops. Soon the raindrops are very big and very heavy. The cloud is full of raindrops. The water cycle starts all over again.
